

GLASS

GLASS SLIMMING

OTS optical sensors have been designed for **glass slimming process**. This is a **fundamental process in the production of mass-market electronics** based on TFT/LCD and OLED displays, because it allows to reduce weight of devices such as TV and mobile phones, by reducing the encapsulating glass thickness.

OTS sensors **measure directly in the slimming chamber** and with **micrometric precision** the thickness of TFT/LCD and OLED panels.

ADVANTAGES

- **measuring during the slimming process**
- **contactless and reflection style measurements**
- **high accuracy**
- **total safety** for operators (non-ionizing and non-radioactive light)
- **easy** to use and integrate
- **multi-channel layout**
- **automatic control of slimming process**
